

# Competitive Academic Agreement Program

## Application of Amorphous Metals for Plastic Pipeline Detection Christopher Martin, Ph.D. 12/12/2017

U.S. Department of Transportation  
Pipeline and Hazardous Materials  
Safety Administration

To Protect People and the Environment From the Risks of  
Hazardous Materials Transportation

# Main Objective

# Evaluate the potential for using amorphous metal foil to enable the belowground detection of plastic pipelines.

# Project Team

- Principle Investigator: Christopher Martin, Ph.D., University of North Dakota-Energy & Environmental Research Center.
- Student Researcher: Daniel Sprengelmeyer, UND Petroleum Engineering.
- Industrial Partner: Eric Theisen, Ph.D., Metglas Inc.

U.S. Department of Transportation  
Pipeline and Hazardous Materials

Hazardous Materials Transportation

# Outline

- Background and Introductory Material
  - Amorphous Metals
  - Magnetic Locating
- Field Distortion Measurements
- Application Concept
- Summary

# Natural Gas Distribution Line Damage

*All reported incident causes for natural gas distribution systems (1996-2015). Source: U.S. DOT Pipeline and Hazardous Materials Safety Administration*

- Excavation damage ranks as the single largest cause of incidents in gas distribution pipelines.
- Over the last 20 years, excavation damage caused \$219 million in reported damages and 109 fatalities.
- 69% of the nation's 2.15 million miles of distribution piping are plastic.

Hazardous Materials Transportation

# Amorphous Metals Introduction

*Polycrystalline  
representation  
with grain  
boundaries.*

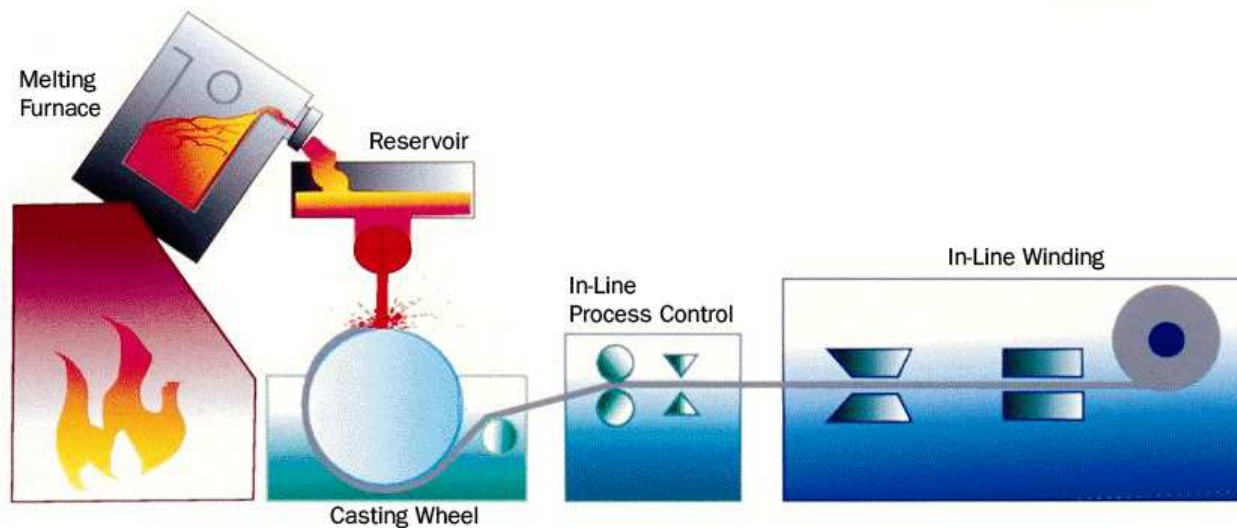

*Amorphous  
material  
representation.*

- Amorphous metals are a non-crystalline, glass-like state of metals and metal alloys.
- Grain boundaries within conventional crystalline metals serve as weak links for material failure, corrosion initiation.
- Two categories:
  - Bulk metallic glasses
  - Amorphous metal foil

# Amorphous Ribbon Production

*Metglas Inc.*

- Amorphous metal foils are produced kinetically by rapid quenching from a molten state.
- Current applications include:
  - Power transformer coils
  - Heating elements
  - Anti-theft tags
  - Brazing foils

*Amorphous Power Transformer Core, Metglas Inc.*

Hazardous Materials Transportation

# Amorphous Metal Properties

## Electromagnetic Property Comparison

Material	Magnetic Field Relative Permeability	Electric Field Relative Permittivity
Vacuum	1	1
Air	$\approx 1$	$\approx 1$
Water	$\approx 1$	81
Concrete	$\approx 1$	4.5
Copper	$\approx 1$	$\approx 1$
Carbon Steel	100	$\approx 1$
Iron	5000	$\approx 1$
Amorphous Metals	50,000-1,000,000	$\approx 1$

## Magnetostatic Field Modeling

4 inch sch. 40  
cast iron pipe

50 micron shell of  
cast iron around 4  
inch pipe diameter  
( $\mu_r = 1000$ )

50 micron shell of  
Metglas around 4  
inch pipe diameter  
( $\mu_r = 80,000$ )

Hazardous Materials Transportation

# Magnetic Locating

- Passive detection method that senses anomalies in Earth's magnetic field.
- Commercially-available detectors.
- Largely unaffected by soil, water, and non-ferrous conductors.
- High sensitivity instruments:
  - Earth's vertical flux density at Grand Forks is ~54,000 nT, typical differential signal range 10 to 1000 nT (0.1 to 10 mG).

Ferromagnetic objects locally distort the Earth's magnetic field and can be detected using the differential signal from two magnetometer sensors. (Schonstedt)

# Differential Magnetic Gradient

*Magnetostatic modeling results for a 4 inch pipe cross section.*

*Relation between magnetic field lines (gray) and lines of constant flux density (red).*

# Field Distortion Measurements

# Data Collection

- Compass direction
- Sensing height and horizontal position
- Starting and ending background readings
- Target reading

# Data Reduction

- Data corrected for background reading and polarity, then averaged.

# Locating Characteristics

Magnetic locating using amorphous metal ribbon:

- Simple, passive
- Low material cost
- Maximum sensitivity with:
  - Vertical ribbon profile
  - Long length
  - Limited depth

## Comparison to Other Locating Techniques

Locating Approach	Amorphous Metal Advantage
Conductive Tracer Wire or Tape with Electric Field Detection	Passive detection, no conductive circuit; lower interference.
Radio Frequency Identification (RFID)	Continuous pathway rather than discrete point marking.
Ground Penetrating Radar and Other Reflected Signal Mapping	Simple, less costly locating instruments needed for uncongested routine marking.
Sonde or Beacon Locating	Pipe internal access not needed.
Magnetizable Plastic Pipe (under development)	Does not alter the composition or the properties of the pipe.

# Detectable Tape Application

- Underground marking tapes are intended to provide a visual warning during digging.
- Aluminum versions can be detected using electric field devices.
- An amorphous-based tape would also be magnetically locatable and optimized for plowed pipe installation.

# In-Ground Trial

- Metglas produced laminated detectable tape prototypes for testing.
- Segments buried at EERC to demonstrate potential use.

# Buried Tape Sensitivity

# Tape Installation Concept

Concept model: silt fence installation.

Rapid installation might be possible with a modified pipe insertion plow.

Hazardous Materials Transportation

# Project Summary

- Collected magnetic field distortion data for a variety of amorphous ribbon parameters: material, geometry, field orientation, etc.
- Magnetostatic modeling was conducted to extrapolate the collected data.
- Findings were synthesized to come up with a detectable tape concept employing amorphous ribbon.
- Industrial partner is investigating the market interest in amorphous foil-based locating tape.

# Project Reporting

- Final Reporting and the student poster paper are available at:

<https://primis.phmsa.dot.gov/matrix/PrjHome.rdm?prj=629>
